  Abstract
  I show that hard information substitutes for soft information and broadens small business credit access. I exploit the staggered rollout of China's Golden Tax Phase III reform, which upgraded digital invoice infrastructure and strengthened record verification. Data on 154,233 loan originations from multiple banks link banks' income assessments to approved contracts. Following the reform, approved credit lines increase by about 20 percent and interest rates fall by roughly 40 basis points. Distance penalties weaken in both bank assessments and loan terms. Banks with less prior industry specialization expand credit more. Estimated credit gains are also larger in industries serving consumers, where transactions leave thinner reporting trails. Lending distance rises by about 14.5 percent, and banks' local portfolios cover about 1.4 additional industries and become less concentrated. By reducing banks' reliance on costly local contact and prior industry knowledge, this information substitution promotes financial inclusion across locations and industries.
